THE DESIGN OF THE GALLUP POLL SAMPLE

The Canadian Gallup Poll maintains a national probability sample in all centres over 1,000 population. A quota sample is used in rural farm and rural non-farm centres. An independent sample of individuals is selected for each survey.

The sampling procedure is designed to produce an approximation of the adult civilian population, 18 years and older, living in Canada except for those persons in institutions such as prisons or hospitals, or those residing in Labrador, the Yukon or the Northwest Territories. Survey data can be applied to this population for the purposes of projecting percentages into numbers of people.

The sample design included stratification by six community size groups, based on the 1971 Census data: Cities of 500,000 population and over, those between 100,000 and 500,000, 30,000 to 100,000, 10,000 to 30,000, 1,000 to 10,000 and rural farm and rural non-farm areas.

Within each of these classifications a further stratification was done by four geographic regions: Atlantic, Quebec, Ontario and the Western Provinces. Within each regional stratum, the population was arrayed in geographic order by community size and within those classifications, by census enumeration areas. Enumeration areas, on the average, contain about 500 to 600 people.

A total of 105 enumeration areas was selected randomly from this array. Within urban centres, a random block sampling procedure was used to select starting points for interviewers. The interviewer is required to follow a specified route in the selection of households. The choice of respondents within urban households is automatically made through a listing of all adults, 18 years of age and over, and the application of a random pre-selection method.

The selection of rural farm and rural non-farm interviewing locations followed the sample design established for urban centres in terms of geographic dispersion and random selection of enumeration areas. Because of the low population density and wide dispersion of households, the random block sampling procedure was replaced by quota sampling based on sex and age.

The design of the Gallup Poll sample has been based on population statistics of the Census of Canada, 1971.
